Web Appendix: Other Potential Mediating Variables

To probe the robustness of our findings regarding welfare's effect on economic voting, we have rerun the models in Table 2 with controls for the institution that should distort clarity of responsibility in the United States (divided government at either the state or national level) and legislative professionalism, which Berry et al (2000) argue enables legislators to insulate themselves from economic sanctions. As noted in the text, these interaction terms are all insignificantly different from 0 and also do not change the overall effect of AFDC benefits.

We also have rerun the models adding controls for manufacturing wages in the state and the average income in the state to ensure that we are not capturing the difference between wealthy states and poor ones. Again, this does not change the results.
